

Aim: Design Calculator using IF action

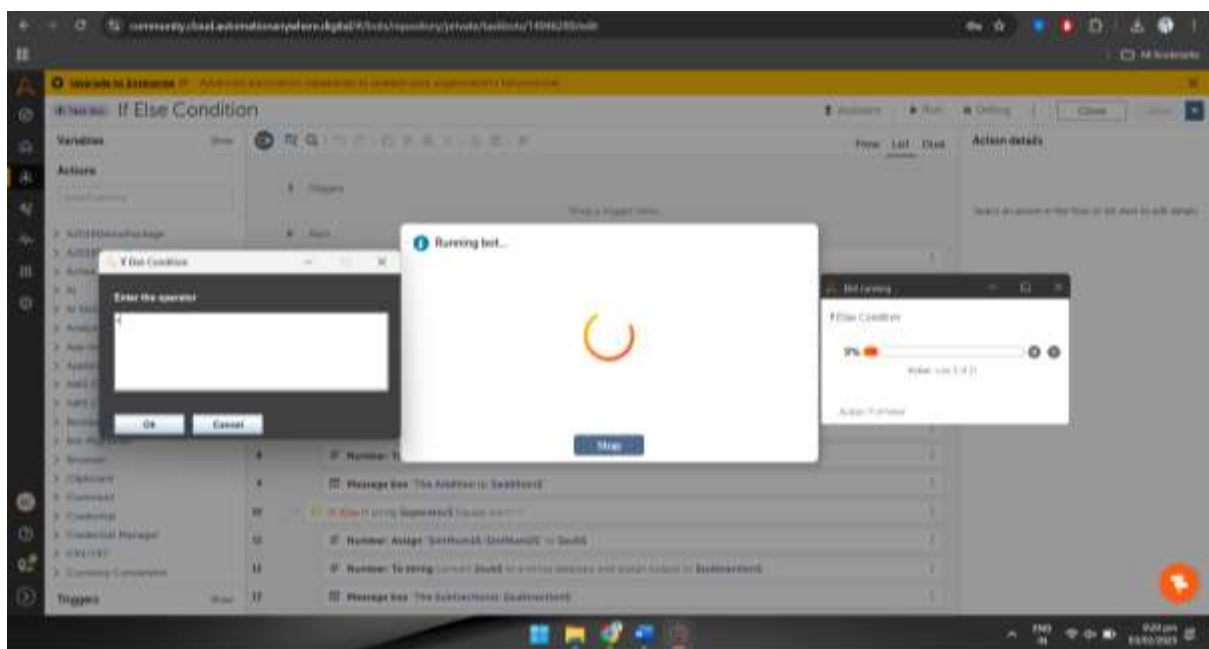

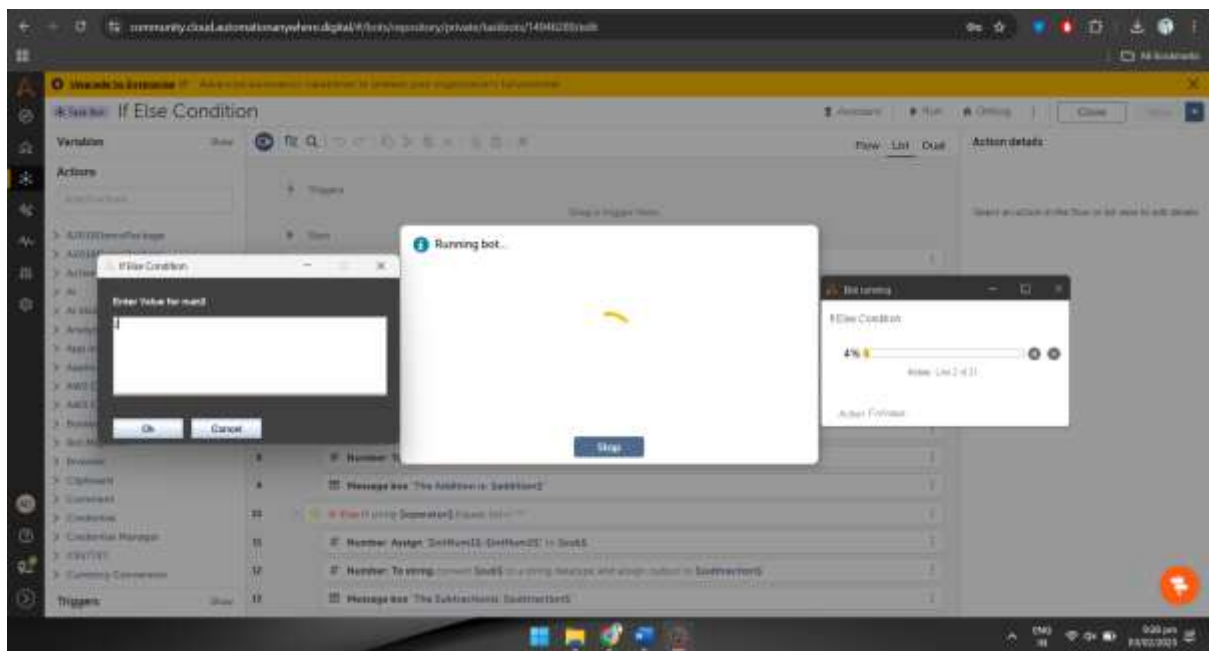

Objectives: To understand how to take user input and use if else conditions on it.

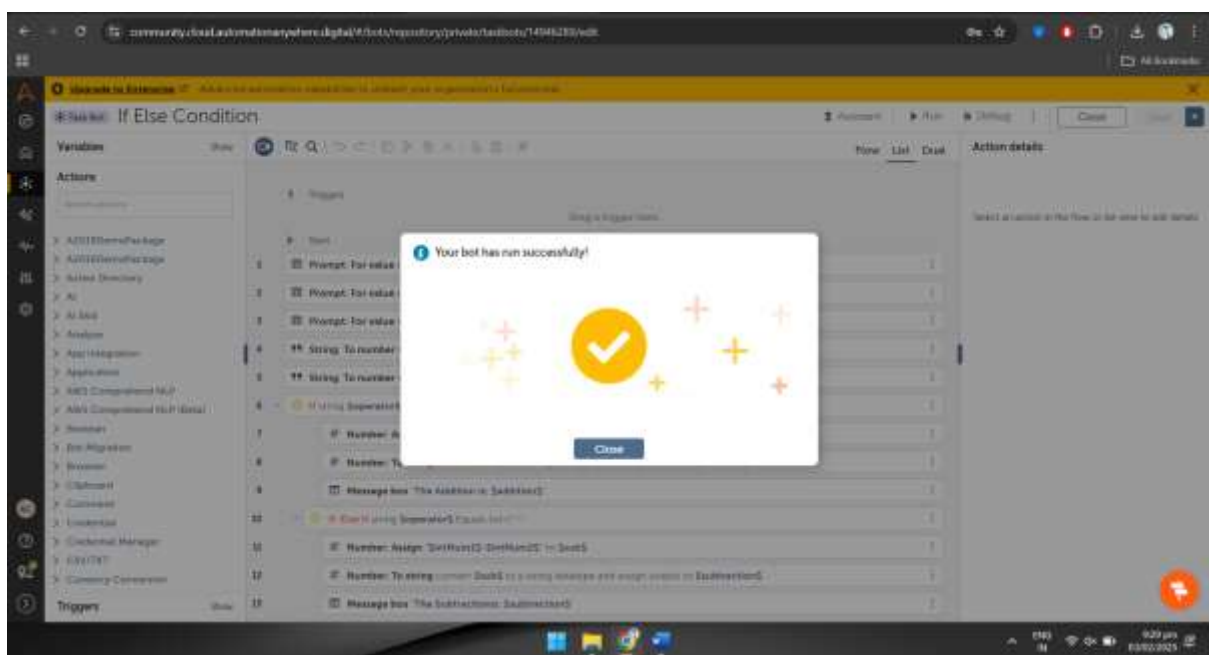

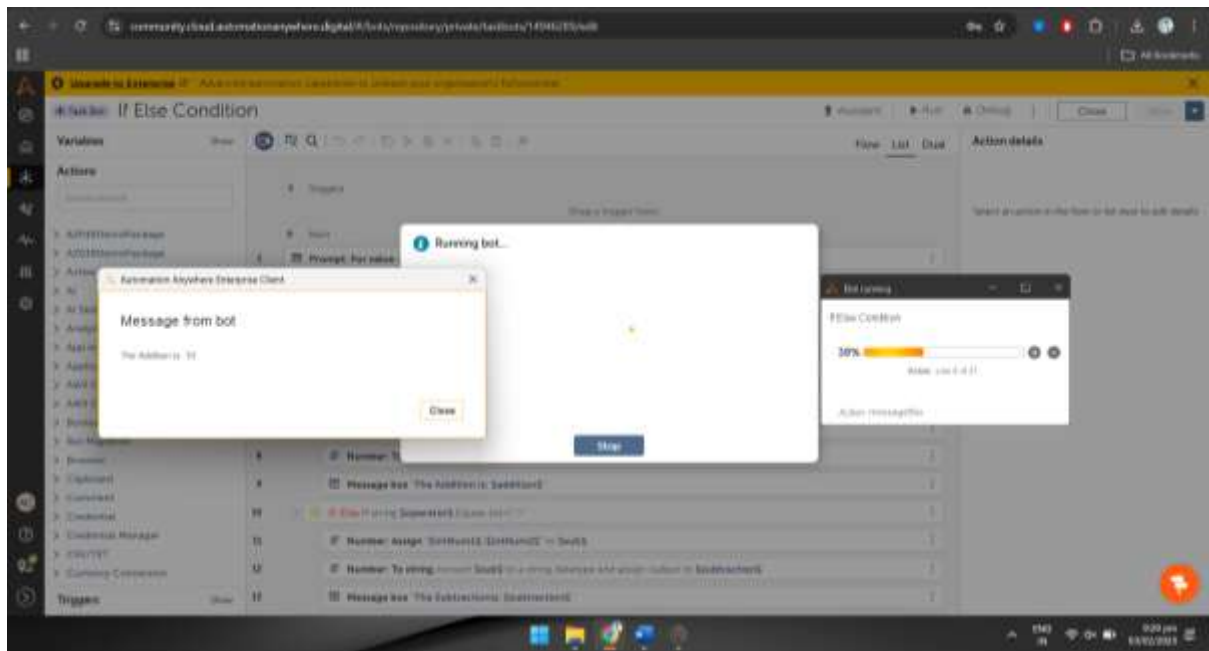

Tools Used: Automation Anywhere.

Concept: A calculator bot can be created in Automation Anywhere using the IF action to process user input and perform arithmetic operations based on conditions.

Problem Statement: To run a simple calculator bot which takes 2 numbers and 1 operator. By using the if else condition and return the expected outputs.

**Observation:**

The bot takes two numerical inputs and an operator as user input.

IF conditions are used to check the operator and perform the corresponding calculation.

The final result is displayed using a message box, ensuring correct execution based on user-provided inputs.
